## Suggested Installation Instructions for:

### 302-735

### 12V Horn

1. The Horn can be mounted to either side support. The position does not matter.
2. You should be able to utilize the horn without making any modifications to the original design. If you fold the wires to the support or dismount the horn from the support, it could cause distortion in the sound.
3. Connect both wires to the terminals located on the horn. Positive and negative wires do not matter in regards to these terminals, either wire should be able to hook to either terminal. (See Figure 1)  
In case your horn works with only one connection, you should install a ground cable as illustrated in Figure 2. If the horn has only one terminal, this is the power terminal. The ground must be made through the mounting bracket. (See Figure 3)
